# Manipulation of Data Part 2 

By Kenneth Leroy Busbee

## Expression

A valid sequence of operand(s) and operator(s) that reduces (or evaluates) to a single value.

## Operator

A language-specific syntactical token (usually a symbol) that causes an action to be taken on one or more operands.

## Operand

## A value that receives the operator's action.

## Precedence

Determines the order in which the operators are allowed to manipulate the operands. Higher precedence goes first.

## Associativity

Determines the order in which the operators of the same precedence are allowed to manipulate the operands.

## Statement

Within "C++" a line of code ending in a semicolon.

# Consider the Statement 

answer $=2<3>=4$;

# Mark the Operator(s) (using an exclamation point or line) 

$$
\begin{gathered}
\text { answer }=2<3>=4 ; \\
!\quad!\quad!
\end{gathered}
$$

# Identify the Precedence (using numbers with 1 being highest) 

$$
\begin{array}{ccc}
\text { answer }=2<3>=4 ; \\
! & ! & ! \\
2 & 1 & 1
\end{array}
$$

# Identify Associativity (using letters with 'a' being first) 

$$
\begin{gathered}
\text { answer }=2<3>=4 ; \\
! \\
2
\end{gathered} \text { 1a } \quad 1 \mathrm{~b} .
$$

## Evaluation

The process of letting the operator(s) do their action to the operand(s).

# Evaluation - Step 1 (this changes to the next slide) 

$$
\begin{gathered}
\text { answer }=2<3>=4 ; \\
! \\
2
\end{gathered} \text { 1a } \quad 1 \mathrm{~b} .
$$

# Evaluation - Step 2 (this changes to the next slide) 

$$
\begin{gathered}
\text { answer }=1>=4 ; \\
!\quad! \\
2 \text { 1b }
\end{gathered}
$$

# Evaluation - Step 3 <br> (this changes to the next slide) 

## answer = 0;

!
2

# Evaluation - Done <br> (the variable answer is assigned the value of ' 0 ' meaning false) 

answer = 0;

## The End
